

# **TAPER-NTP**

# **Tape-loading components**

The tape module TAPER-NTP serves to package components in blister tapes. Placing the individual components in the blister tape is first followed by an optional placement check using a camera system, the tape transport and then sealing of the blister tape with a cover tape and winding of the tape. Tape modules for different tape widths are available, which can also be combined in a single machine, if necessary.

# **Product description/functions**

- Coiler at the front
- Cover tape reel at the front
- Decoiler separate assembly on the machine frame, but required to operating the tape module
- Placing the empty blister tape manually
- Passage of the blister tape via sprocket wheel-fed fixed width transfer rail
- Optionally integrated vacuum suction strip in the transfer rail for fixing the components in the blister tape
- Camera for placement check for verifying the correct placement position of the components in the tape pockets
- Empty pockets sensor for verification of pocket filling and detection of possibly developed empty spaces
- Sealing station for sealing the cover tape on the blister tape
- Automatic cutting of the blister tape by integrated tape cutter
- Internal storage of module parameters
- Filling level monitoring of decoiler
- Sensor monitoring of cover tape reel

Tape width	8 / 12 / 16 / 24 / 32 / 44 mm	
Placement	2-fold / 4-fold	
Camera / Image processing	OCR camera (In-Tape Inspection, separate assembly) / placement check in tape	
Suction strip	Possible option	
FMKIT	<u>Foreign Material:</u> In the event of soiling, loose foreign particles are moved from the pockets of the blister tape through compressed air supply and vacuum suction cup before tape-loading the components.	
FWFTUR	<u>Firewall:</u> Protection from mixing up reels – A scanner on the coiler reads the barcode of the winding reel. The module features an internal interface to a decoiler with firewall, without its firewall cannot be operated.
